

PRODUCT & BI ANALYST — DATA CHALLENGE

Growth runs on first purchases

Customers, churn and a free-shipping policy — and three moves to act on it.

Growth runs on first purchases

Revenue, Aug 2026 \$115K +111% year over year	From first-time buyers 84% of revenue, last 12 months	Buy again within a year 1 in 6 median wait: 412 days	Free shipping over \$100 -26% gross profit, simulated
--	--	---	--

WHAT WE FOUND

- 1 Revenue **+111%** — all volume; basket size flat
- 2 **84%** of revenue from first-time buyers; few come back
- 3 Free shipping over \$100 **pays for baskets that already exist**

WHAT WE SHOULD DO

- 1 **Win the second purchase** in the first 60 days
- 2 **Free shipping on the second order** — US first
- 3 **Fix measurement** before scaling decisions

Revenue +111% — driven by volume, not basket

+129%

orders, year over year

\$75–\$94

order value — flat for 2 years

\$946K

revenue, last 12 months (+70%)

84% of revenue comes from first-time buyers

+12%
spend per returning customer vs new

-8%
revenue if new customers fall 10%

70%
of first-time buyers come from Search

Even over a full year, 90% don't come back

95.8% → 89.7%

churn at 90 vs 365 days

94.1% → 88.5%

if all valid orders count, not only 'Complete'

90-day churn by channel

The first order is 89% of two-year value

Month 1 is the best chance of a second purchase.

Cohort retention — % buying again in month N

	M1	M2	M3	M4	M5	M6	M7	M8

Cumulative spend per customer

Three moves to build a repeat base

1

Win the 2nd purchase in 60 days

Month 1 is the repeat peak (3.1% vs 0.9%).

TARGET	All first-time buyers — by timing, not channel
KPI	12-month repeat vs holdout (today 16.2%)
GUARDRAIL	Incentive cost per extra order

+3 pts ≈ **\$25K**/yr

2

Free shipping on the 2nd order

Not over \$100: 91% of those parcels go to baskets that already exist.

TARGET	US first-time buyers (23% of revenue)
KPI	90-day repeat vs holdout (today 4.4%)
GUARDRAIL	Gross profit after shipping

Breaks even at **+1.4 pts**

3

Fix measurement first

‘Complete’ is a random 25% of orders; 90 days is too short a churn window.

DO	Agree “sale” with finance · 12-month churn · automated QA
KPI	QA pass rate · data freshness

Makes 1 and 2 **measurable**

Free shipping over \$100 lifts revenue, cuts profit

Simulated impact: gross profit after shipping -26%.

Orders over \$100 — share of all orders

Gross profit per month — after shipping

28% → 31%

orders over \$100

+1.1%

revenue

< \$1

break-even cost per parcel — 91% go to orders already over \$100

What each metric means — and when to change it

METRIC	DEFINITION USED	ALTERNATIVE	USE THE ALTERNATIVE WHEN...
Churn	Active in month M, no order in the next 90 days	12-month window	Purchases are infrequent (here: median 412 days)
Active customer	≥ 1 completed order in the month	Active in the last 12 months	The product is bought once or twice a year
New vs returning	New in the month of the first completed order	Returning = bought in last 12 months	The question is reactivation, not acquisition
Cohort	Month of first completed order	Signup month	Measuring activation, not repeat
Funnel	Signup → order → activated → 2nd order	Session: product → cart → purchase	Session data is real (here it is template-generated)
Product-change KPI	Primary: behaviour targeted · Guardrail: profit after its cost	Revenue alone	Never — revenue hid the free-shipping loss

One fact table, two joins, zero fan-out

JOIN RULES

1. **Grain first** — one row per line item
2. **Count rows** before and after every join
3. **Skip joins** that add no columns (orders)
4. **Aggregate** before one-to-many joins

Four data traps, all handled

Order status by year — a 2019 order is still 'Shipped'

632 rows dated after today — excluded

25% of items 'Complete', every year — status is random

3 months with no full churn window — flagged, not reported

0 empty columns — every null is structural

Session data can't measure conversion

events — anonymous traffic is a constant

Order timing — orders fall at random between signup and today

The funnel we use — per user

- 100 signed up
- 80 ordered
- 27 activated
- 12 2nd order

±0.6 pts
across channels

Seven metrics leadership should watch

ACQUISITION

ACTIVATION

RETENTION

MONETIZATION

DATA HEALTH

✓ last complete month Aug 2026

✓ 632 future rows excluded

✓ QA 4/4 passing

✓ as of 2026-09-24

AI drafted the work; checks decided what stayed

USED FOR • Profiling tables, nulls and join keys • First drafts of every query • This deck, generated from the SQL outputs	CAUGHT BY CHECKS • 100% churn months = edge of the data • A metric that was 100% or 0% by construction • “Conversion” rising 17× on a constant denominator	HOW I VALIDATE • Row counts before / after joins • Identity checks that must return 0 rows • Same metric, two definitions
---	---	--

EXAMPLE PROMPT

“Churn is ~100% for the last three months. Before treating it as real, what at the data boundary could cause it — and write the SQL check that tells an artifact from a real spike.”
